

Committee: United Nations Commission on
Science and Technology for Development-2 (UNCSTD-2)

Agenda Item: The Role of Technology in
Combating the Climate Crisis

Country: Türkiye

Delegate: Mehmet HİTİT

Türkiye is located at the between Europe and Asia. Its neighbors are Greece, Bulgaria, Armenia, Iran, Iraq and Syria. Türkiye has a rica geography. There are beautiful, long coastlines, big mountains, and fertile plains and its population is abone 85 million. Many Turkish people make their living from agriculture, tourism and industry. This makes the environment very important for our country's future. Türkiye lives four seasons and it is very aware of the effects of climate change and its results in the future.

The climate crisis is not just a future problem; it is a reality of our fay. As the Republic of Türkiye, we believe that science and technology are the most powerful ways we have when protect to our planet. Our country is located in the Mediterranean region, it is one of the places most affected by global warming. Therefore, using technology to fight climate change is a top priority for us.

Türkiye made very important steps in this problem. One of our biggest projects is "Zero Waste" initiative. For example we buy plastic bags if we want to use . We also use smart technology to increase recycling rates and conscious in our country. Also, Türkiye invests a lot in renewable energy. We are now among the top countries in Europe with solar and wind energy capacity. We believe that "Green Technology" should be accessible to everyone.

However, we use technology but it isn't enough alone. The UNCSTD must ensure that developing countries can use these new inventions. Türkiye suggests that we should share technical knowledge and be active in the solution. We also support the use of AI and satellite data to predict natural disasters like forest fires or floods. This year we experienced these disasters and we know its importance

In conclusion, Türkiye tries to apply the Paris Agreement and our "2053 Net Zero Emission" goal. We want to work with all member states to create a world to have technology servine nature, not destroying it. We must act together now and share our knowledge,solutions and ideal. Don't forget this we don't have a "Planet B."
