

Committee: UN-HABITAT

Country: Algeria

Agenda: Building Sustainable and Smart Cities of the Future

Algeria is a country in North Africa, near the Mediterranean Sea, and it is the biggest country in Africa. Many people in Algeria earn money from oil and natural gas, but some people also work in farming. Health care is free for everyone, and children must go to school until age 16. Most of the population is young, and many young people can help build the future of the country.

Because the population keeps growing, Algeria needs more safe, smart, and sustainable cities. Some families still live in crowded or unsafe places. Cities need better roads, green areas, and modern services to become cleaner and safer for everyone. People need homes where they can live comfortably and learn more about the future.

Algeria has already started taking action to make better cities. The government built new towns such as New Bougezhoul and Sidi Abdallah. These towns have modern services, green spaces, and better planning. Algeria also moved families from unsafe houses to safer areas. The country has rules about land use and city planning to make cities more sustainable for the future.

Algeria thinks it is important to continue improving cities. There can be rules to build only smart and sustainable houses. People can learn about sustainability through education, posters, and digital videos. Young people can join city projects and share creative ideas. Algeria wants to work with other countries to build safe and smart cities where everyone can live happily.
