

Committee: Disarmament and International Security (DISEC)

Issue: Promoting the Peaceful Use of Outer Space

Country: Indonesia

The Republic of Indonesia recognizes that the use of outer space has become a serious issue in the last decades. The growing race between nations and private companies has just increased the concerns about the weaponization and militarization of space. This race cannot be ignored or underestimated. Since the end of the Cold War, tensions over space activities have only become even more serious, creating hostility between countries and private companies.

Indonesia truly believes that outer space must remain a place that use for peace, cooperation, and scientific experiments. Our national institutions, such as the Indonesian Space Agency Secretariat (INASA) and the Research Organization for Aeronautics and Space (ORPA–BRIN), are working to address these problems and find solutions. We give value the ideas of students, researchers, and the public in changing our vision for the peaceful use of space.

- Nations should unite under the name of humanity, rather than competing under company or countries.
- All countries must approve agreements that ban of the deployment of weapons and military activities in outer space.
- Outer space must be considered untouchable for military purposes, reserved for only peaceful exploration and scientific experiments.
- By joining forces and combining our powerful sides, the international community can make sure that space remains a safe and cooperative environment.

Indonesia is committed to promoting the peaceful use of outer space. We believe that through cooperation, honesty, and responsibility, nations can prevent the militarization of space and make sure that it serves to whole humanity.
