

Committee: Economic and Social Council (ECOSOC)

Topic: Health Issues caused by Air Pollution in Türkiye

Türkiye is a country between Europe and Asia. It has many cities, mountains, and scenic locations. Many people reside in major cities such as Istanbul, Ankara, and Izmir. These cities have a big population. People work in a variety of industries, including transportation, factories, and agriculture. People come from diverse ethnicities in Türkiye. The country has an excellent educational system and healthcare facilities. However, air pollution remains a major concern in Türkiye. Smoke from vehicles, buses, and factories pollutes the atmosphere and occasionally gives the sky a hazy appearance. This is crucial because clean air is necessary for maintaining good health.

Türkiye has had an issue with air pollution for a long time. Coal is used by some families to heat their homes in the winter, which only makes the air quality worse. Many individuals have respiratory difficulties as a result of pollution, such as asthma or coughing. According to doctors, dirty air can also contribute to heart disease. Moreover, polluted air can also harm lungs, weaken the immune system. Türkiye signed the Paris Climate Agreement and enacted laws to decrease harmful smoke. Türkiye has attempted to address this issue. Additionally, the government promotes the use of cleaner energy and the planting of more trees. Although these are helpful, there is still more to be done.

Türkiye aims to safeguard the public's health by improving air quality. The nation intends to rely more on renewable energy sources like solar and wind energy. Additionally, it aims to enhance public transportation to reduce automobile usage. According to Türkiye, UN should assist nations to facilitate scientific study and spread environmentally friendly technology. This committee should concentrate on shielding children and families from air pollution. If all countries collaborate, we may make the air cleaner and safer for everyone.
