

Country: Bulgaria
Committee: Legal

Bulgaria, officially the Republic of Bulgaria, is a country in Southeast Europe. It's positioned on the eastern hand of the Balkans, and is framed by Romania to the north, Serbia and North Macedonia to the west, Greece and Turkey to the south, and the Black Sea to the east. Bulgaria covers a home of,994 square kilometres(,855 sq mi), and is the sixteenth- largest country in Europe. Sofia is the nation's capital and largest megacity; other major metropolises are Plovdiv, Varna and Burgas.

As Bulgaria's representative on the Legal Committee, I believe that inheritable engineering raises important ethical and legal questions. We must precisely weigh the implicit benefits and pitfalls of this technology and establish clear regulations to insure that ethical and legal norms are met. We support the responsible use of inheritable engineering to improve mortal health and quality of life, and to promote sustainable development. Bulgaria urges the transnational community to work together to establish a global regulatory frame that can guide the responsible use of inheritable engineering.

likewise, Bulgaria believes that any regulations must cover individual rights and help demarcation. It's essential to insure that the development of genetically modified organisms doesn't lead to the exploitation of individualities or communities. We must also consider the implicit impacts on the terrain and biodiversity.

Bulgaria acknowledges the implicit benefits of genetic engineering in areas similar as healthcare, agriculture, and environmental conservation. still, we must approach this technology with caution and insure that it's used in a responsible and ethical manner.

In conclusion, Bulgaria urges the Legal Committee to address the ethics and legitimacy of genetic engineering with a sense of urgency. We must establish clear guidelines to insure that this technology is used for the greater good and doesn't violate individual rights or cause detriment to the terrain.

Thank You
