

Committee: The United Nations Environment Programme (UNEP)

Topic: Next Phase in Combating Climate Change

Country: South Africa

Delegate: Anil Sarikoc

Contemporary societies are faced by a new spectre haunting the 'globe' the changing of the world's climate. Climate change refers to long-term shifts in temperatures and weather patterns. It affects people's life. Humans are risking the health of the natural environment through a myriad of intervention. Climate change includes both global warming and effects on Earth's weather patterns. Since the pre-industrial time, human activities are estimated to have increased Earth's global average temperature get higher.

Understanding and predicting temporal variations in South African climate has become the major challenge facing South African and African-specialist climate scientists in recent years. Climate Change in South Africa is leading to increased temperatures and rainfall variability. This is a critical concern for South Africans as climate change will affect the overall status and wellbeing of the country, for example with regards to water resources. Our economy affected badly, Our plants can't grow easily. In the globe, Human economic well-being is affected by the efficiency by which societies convert various inputs ( natural resources, physical capital, human capital, labor etc...) into goods and services that raise the standard of living of those who consume them. Impacts on people from Climate Change will increasingly affect South Africaduetomanyfactors.

Many people still think of climate change as a phenomenon that we will only face in the distant future. We can use more eco-friendly fuels on planes, We can do campaign for using electric cars. We can punish the one who cuts the trees without permission, like a man cuts a tree we will get £10000 from him and If the tree is older than 10 years the man gets extra £20000 penalty. We can close forests for farming because farmers cut down the trees for space that they can plant vegetable seed. We can increase the tax for those who use plastic materials or make plastic materials. If that man/woman doesn't pay his/her tax, it will be added £10000 + his/her tax. Then no one will cut down trees or no one will use unecological things. Reducing the absorption of carbon within the atmosphere is important. Informing people by telling them that Climate Change is bad and It's bad for our health.
