

**COMMITTEE:** United Nations Environment Programme

**TOPIC:** Promoting the Development of Nuclear Technology as a Safe and Sustainable Energy Source of the Future, The Effect of War Preparations on the Environment, The Influence of Covid-19 pandemic on the environment

**COUNTRY:** PHILIPPINES

Natural wonder Philippines has many sustainable energies. Nuclear energy, which is very popular these days, seems to be an alternative for the Philippines. But some factors are overlooked. And these neglected factors can lead to enormous disasters later on. If something goes wrong it can create nuclear meltdown, causing to huge catastrophes. And these disasters have a bad effects on human body, plants and animals. Shortly, our world. As Philippines president Duterte said, "We are all affected in case of a nuclear leak, and this is our country, don't forget that."

As a delegate of the Philippines, we do not support war preparations and weapons. Because these activities affects our environment in a bad way. And these activities is not only affect environment. It affect humnas health in some way. On the other hand, war preparations and weapons affects people's social effect. For example; production of, storage of and testing of weapons will naturally pollute the water, air and land. These pollutions forced people to move an other place. This incident puts people in a difficult situation.

Like we know covid 19 become a threat for human life. And this virus forced humanity to stay at home for months. Quarantine opened an invitation to new research. on human health and on air pollution. If we talk about the side of air pollution, we can we can see that all around the world air pollution is getting less during the quarantine. However, the scientists says, " That quality of air will not be longer. It will be like old days when the pandemic is over." . Actually, it is very sad. As we know, air pollution is due to most airplanes. When the pandemic start, global travelling was stop. That's why so many country affected in an economic way.

Finally, the things we mentioned above pollute our world and pose a threat to us and other living creatures in the world. This pandemic we have been experiencing recently has made us appreciate the value of our environment. not only the environment but also our own health. That's why we should take good care of our world and pass it on to future generations.
