

Committee: UNEP

Country: Mexico

Agenda Item: Enhancing the transition to sustainable energy as a response to the energy crisis and climate change

Mexico is truly aware that climate change is a huge issue in our modern world. Though it is something that affects us globally, there are specific countries and regions which are influenced more than the others in unbelievable conditions. Not only does this just act on us humans, but also contributes on a frequent loss of various animal species. This is something that cannot be neglected, so the most efficient way to solve it for now is improving sustainability in every country, which will at least help the prevention of useless energy consumption. It might sound easy to solve climate change in this specific case but encouraging everyone to take action is the challenge Mexico faces, not only in this matter but additionally in other global concerns, too. Mexico would also like to mention that they are aware of the countries which are severely affected by the energy crisis and the dramatic change in climate, and that they would be honored helping them with anything that will decrease the problems that are being faced. In addition, Mexico is open to any sort of critical discourse regarding their country's position, and would be delighted to hear further proposals in order to improve the shortcomings of their policy.

Although Mexico has been from one of the countries that produce the majority of the greenhouse gases, they have been trying to improve their situation since 2013 by limiting the community from using additional unrenovable energy by increasing gas prices, as well as encouraging their members to use solar energy, and rewarding renewable energy producers with an outstanding certificate that proves them that they did something to improve the situation. Mexico's process in radiating the usage of renewable energy may not be as fast as other member states, but also promises in reducing the majority of the carbon footprint by 2050, such as legislating new, reasonable laws to force the society to completely change their mindset about the "ignoring" of climate change and gas usage.

To specify the needed solutions for enhancing sustainability globally, Mexico would be pleased to address some main resolutions, followed by their sub-items which are rather related to the main points. Informing every being in every nation is key for solving the majority of the issues worldwide, as most of them prefer to ignore the negatives of life. Not only do they ignore the issue, they also do not see it as a problem to clearly express their "opinion" on climate change, saying no such thing exists. To help reduce the ignorance in countries, seminars to definite regions could be possible in our modern future, which they also leave a deep memory in the participators' brains by showing them actual footage on how their gas usage could result in polar bears' and many other organisms' death. These organizations which are particularly designed to change the ignorant perspective on the matter will eventually inform the majority, worldwide.
